Concrete Connectors & Anchors

MASA/MASAP *Mudsill Anchors*

SIMPSON Strong-Tie

USE ENGINEERED

This product is preferable to similar connectors because of a) easier installation, b) higher loads, c) lower installed cost, or a combination of these features.

Mudsill anchors have always been a time-saving alternative to anchor bolts, and the new MASA anchors provide even greater load-carrying capacity than our original MAS. As a result, the MASA provides an alternative for ½" and ⅝" mudsill anchor bolts on 2x, double-2x and 3x mudsills. It also eliminates the need for 3" square plate washers for seismic design and, in some cases, has load capacities that meet or exceed the parallel and perpendicular to plate shear capacity of other cast-in-place anchors. Two versions of the MASA are available – the standard MASA for installation on standard forms and the MASAP for panelized forms.

The MASA and MASAP are code listed by ICC-ES under the 2006 and 2009 IBC® and IRC® and have been tested to meet the requirements of ICC-ES acceptance criteria AC-398 for cracked and uncracked concrete. New test data is reflected in the table below.

MATERIAL: 16 gauge

FINISH: Galvanized, all available in ZMAX® coating. See Corrosion Information, page 18-19.

INSTALLATION: • Use all specified fasteners. See General Notes.
- **MASA/MASAP**
  - Concrete shall have a minimum f'_c = 2500 psi.
  - Spalling—Contact Simpson Strong-Tie for load reductions. Any exposed portion of the mudsill anchor must be protected against possible corrosion.
  - For prescriptive anchor spacing refer to page 33.
  - Testing shows that these mudsill anchors can be used in lieu of code required anchor bolts and square washer in high seismic zones. Refer to filer F-MASA for additional information.

CODES: See page 20 for Code Reference Key Chart.

1. Loads are based on allowable stress design (ASD) and include the load duration factor C_D (with C_D = 1.6) for wind/earthquake loading. No further increase is allowed. Reduce where other loads govern.
2. Minimum concrete compression strength, f'_c is 2500 psi.
3. Allowable loads are based on a minimum stemwall width of 8".
4. For simultaneous loads in more than one direction, the connector must be evaluated using the Sum Rule Equation.
5. Per Section 1613 of the 2006 IBC, detached one- and two-family dwellings in SDC C may use the "Wind and SDC A&B" allowable loads.
6. For designs under the 2006 IBC in SDC D-F, a Sill plate is required when the allowable design shearwall shear load is equal to or greater than 600 plf. If the allowable design shear load is greater than 350 plf but less than 600 plf, it is acceptable to use a 2x sill plate provided that the sill is anchored using double the number of MASA mudsill anchors required by design.
7. For designs under the 2009 IBC, sill plate size shall comply with the shearwall requirements of the 2008 Special Design Provisions for Wind and Seismic. MASA spacing shall be as required for design load.
8. MASA/MASAP may be installed using 7-nails (triangle holes not filled) when being used to replace a ½" diameter sill bolt for use on a 2x mudsill.
9. **NAILS:** 10dx1½" = 0.148" dia. x 1½" long. See page 24-25 for other nail sizes and information.

Concrete Connectors & Anchors

LMAZ/MA/MAB/MASB *Mudsill Anchors*

SIMPSON Strong-Tie

Mudsill anchors provide an alternative to anchor bolts. They easily mount on forms and make finishing easier. The unique design pro-vides installation flexibility, eliminating problems with misplaced anchor bolts. Suitable for stem wall or slab foundations, mudsill anchors are one place so there are no more nuts and washers to lose.
- LMAZ—an economical replacement for ½" sill plate anchor bolts
- MA—for slab or stem wall construction
- MAB—anchors mudsill to concrete block, poured walls or slab foundations

MATERIAL: LMAZ, MAB—18 gauge; MA/MASB—16 gauge

FINISH: MA, MAB, MASB—*Galvanized (some available in ZMAX® coating)*; LMAZ—ZMAX only. See Corrosion Information, page 18-19.

INSTALLATION: • Use all specified fasteners. See General Notes.
- **LMAZ/MA/MAB:**
  - CMU shall have a minimum $f'm$ = 1500 psi and concrete shall have a minimum f'_c = 2000 psi.
  - Not for use where a horizontal cold joint exists between the slab and foundation wall or footing beneath, unless provisions are made to transfer the load.
  - Not for use in slabs poured over foundation walls formed of concrete block or with brick and 4" masonry block stemwalls.
- **MASB:**
  - Fill CMU cell with concrete grout first, then place MASB into the grouted cell and adjust into position. Attach mudsill to anchor only after the concrete grout cures.
  - CMU shall have a minimum $f'm$ = 1500 psi.
  - The MASB Mudsill Anchors were tested in standard 8" CMU.

AB/ABA/ABE/ABU *Adjustable and Standoff Post Bases*

SIMPSON Strong-Tie

Additional standoff bases are on page 199.

The AB is an adjustable post base which offers moisture protection and finished hardware appearance.

These post bases feature 1" standoff height above concrete floors, code-required when supporting permanent structures that are exposed to the weather or water splash, or in basements. They reduce the potential for decay at post and column ends.

MATERIAL: AB—12 gauge plates; 16 gauge base cover; all other—see table

FINISH: Galvanized. Some products available in ZMAX® coating; see Corrosion Information, page 18-19.

INSTALLATION: • Use all specified fasteners. See General Notes.
- Post bases do not provide adequate resistance to prevent members from rotating about the base and therefore are not recommended for non top-supported installations *(such as fences or unbraced carports)*.
- All supplied as shown; position the post, secure the easy-access nut over the supplied washer, place the standoff base, then bend up the fourth side and nail all sides.
- AB, ABA, ABE and ABU—for pre-pour installed anchors. For epoxy or mechanical anchors, select and install according to anchor manufacturer's recommendations; anchor diameter shown in table.
- Products require washers between the nut and the base. Washers are supplied with all products except ABA's which require a standard cut washer.

2. Downward loads may not be increased for short-term loading.
3. Spacifier to design concrete for shear capacity.

1. Uplift loads have been increased for wind or earthquake with no further increase allowed; reduce where other loads govern.
2. Down loads may not be increased for short-term loading and shall not exceed the post capacity. See pages 210-211 for common post allowable loads.
3. CC uplift loads do not apply to splice conditions.
4. Splice conditions with CC's must be detailed by the Designer to transfer tension loads between spliced members by means other than the column cap.
5. Column sides are assumed to lie in the same vertical plane as the beam sides. CC4.62 models assume a minimum 3½" wide post.
6. Structural composite lumber columns have sides that show either the wide face or the edges of the lumber laminations. Values in the tables reflect installation into the wide face. See technical bulletin T-SCLCOLUMN for values on the narrow face (edge) *(see page 215 for details)*.
7. Beam depth must be at least as tall as H_1.
8. For 6¾" engineered lumber, use CC 6¾ or ECC 6¾ models.
9. CCO welded to steel column will achieve same load as CC. Steel column width shall not be less than beam width. Weld by Designer.

ECCLQ/CCCQ/CCTQ *Column Caps*

SIMPSON Strong-Tie

The ECCLQ, CCCQ and CCTQ column caps provide high capacity, multiple beam to column connector options. The design uses Simpson Strong-Tie® Strong-Drive® screws (SDS) to provide faster installation and a lower profile compared to standard through bolts. Screws are con-figured to provide high uplift design values.

MATERIAL: 7 gauge

FINISH: Simpson Strong-Tie® gray paint, also available in HDG

INSTALLATION:
- Install Simpson Strong-Tie SDS ¼"x2½" wood screws, which are provided, in all round holes. *(Lag screws will not achieve the same load.)*
- No additional welding is allowed.

OPTIONS:
- Many combinations of beam and post sizes can be manufactured *(refer to worksheet T-CCQLTC-WS)*.
- Available in widths up to 9"x16".
- ECCLQ is available in left or right side beam orientations. Specify ECCLLQ or ECCLRQ.
- Straps may be rotated where $W_1 > W_2$.
- Column caps may be ordered without the column straps for field welding to a column. No loads apply. Specify CCCQQ/CCTQQ/ECCLQQ.

ORDERING:
- The L dimension varies depending on the width of the side stirrup (W_3 or W_4). Contact Simpson Strong-Tie for exact dimensions.
- Main beam stirrup height (H_1) is 7". Side beam stirrups (H_2 or H_3) can vary in height with the minimum height of 7". Specify the side stirrup height from the top of the cap.
- Example Order: 4x Main Beam, 6x Post, 4x Side Beam *(oriented to the left)* is ordered as an ECCLLQ464SDS

CODES: See page 20 for Code Reference Key Chart.

Series	Allowable Loads: Uplift (160) Main Beam	Uplift (160) Side Beam	Uplift (160) Total[2]	Download (160) Side Beam	Download (160) Total	Code Ref.

1. Uplift loads have been increased for wind or seismic; reduce where other loads govern. Downloads may not be increased.
2. Allowable load is per post. Side beams must be loaded symmetrically for the CCCQ.
3. The combined uplift loads applied to all beams in the exercise must not exceed the total allowable uplift load listed in the table.
4. The ECCLQ side beam may use a side beam uplift load up to 2350 lbs. The deflection of this load may exceed the standard ¼" deflection by an additional ¼".
5. The combined download for all of the carried beams shall not exceed the allowable download for the unmodified product on page 66 *(CCQ load for CCCQ and CCTQ, or ECCQ load for ECCLQ)*. The download for each side beam shall not exceed the lesser of 25% of the allowable download or 9055 lbs. for the unmodified product.
6. The download to each side beam shall not exceed the allowable load for the unmodified product, whichever is lower.
7. Column width in the direction of the beam with must be the same as the main beam width (W_1).

ECCL/CCC/CCT *Column Caps*

Column to beam connections often have multiple beams framing on top of a column. L, T, and Cross column caps provide design solutions for this application. Many combinations of beam and post sizes can be manufactured *(refer to worksheet T-CCLTC-WS for details)* with the following criteria applied:
- The download capacity shall be determined from the capacity for the unmodified product *(see page 67)*. The side beam can take a maximum of 40% of the download and shall not exceed 10,665 lbs. The sum of the loads for the side beam(s) and main beam can not exceed the table load.
- Uplift loads do not apply for ECCL caps. For CCC and CCT, uplift loads from table apply for main beam only.
- The column width in the direction of the main beam width must be the same as the main beam width (W_1).
- Specify the stirrup height from the top of the cap. The minimum side stirrup heights (H_2 or H_3) is 6¼" (3½" for 4.4 g).
- The L dimension may vary depending on the width of the side stirrup (W_3 or W_4).
- Column caps may be ordered without the column straps for field welding to a column. No loads apply. Specify CCCQ/CCCT/ECCQL.

Ordering Examples:
- A CCC66 with W_3 = 5½", H_2 and H_3 = 6½" is a CC66 column cap with 5½" beams on each side with all beam seats flush.
- An ECCLR66 with W_3 = 3½", H_2 = 7⅛" is an ECC66 end column cap with a 4x beam on the right side *(specify direction left (which is shown) or right for stirrup)* and stirrup seat 1" below the cap seat.

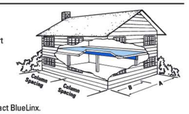
GP Lam® LVL Handling & Installation

- GP Lam® LVL shall not be stored in direct contact with the ground and must be protected from weather. Provide air circulation under covering and around stacks of materials.
- Bundles must be stored level and must not be opened until time of installation.
- Stack and handle GP Lam LVL flatwise.
- Handlers and installers should use appropriate personal protective equipment such as gloves and goggles. An MSDS is available at www.gp.com/build.
- Engineered lumber must not be installed in direct contact with concrete or masonry construction or shall be protected per code and shall be used in covered, dry use conditions only (moisture content is less than 16%).
- Minimum bearing length for GP Lam LVL beams and headers: end bearing 1½", intermediate bearing 3". Size for applied loads.
- GP Lam LVL beams and headers must be restrained against rotation at ends and supports and the top (or compression edge) must be laterally supported by perpendicular framing or bracing at 24" on-center or closer.
- 1¾" GP Lam LVL beams deeper than 14" must only be used in multiple-piece members.
- Nails installed in the narrow face of GP Lam LVL shall not be spaced closer than 4" (10d common nails) or 3" (8d common nails).
- Multiple-piece GP Lam LVL may not be stagger-spliced as is commonly done with dimension lumber. If the required length of a multiple-span beam exceeds the available length of the LVL, the LVL beams must be installed so as to butt together over a common bearing.
- GP Lam LVL is manufactured without camber or specific vertical orientation. It may be installed with the identifying stamps on the side faces reading right side up or upside down.
- Strength and stiffness properties of GP Lam LVL exceed those of typical dimension lumber. It may be possible to substitute GP Lam LVL for dimension lumber roof members in code-prescribed conventional light-frame construction, but design of conventional construction is beyond the scope of this product guide and of BlueLinx Engineered Lumber Technical Services.
- When nail type is not specified in this guide, use common, box or sinker.
- To help safeguard the structural integrity of connections with preservative or fire-retardant treated wood, use only hot-dipped galvanized or stainless steel fasteners, connectors and hardware as required by code and type of treatment.

  As a minimum requirement, hot-dipped galvanized coated fasteners should conform to ASTM Standard A 153 and hot-dipped galvanized coated connectors should conform to ASTM Standard A 653 (Class G-185). In demanding applications, or in highly corrosive environments, stainless steel fasteners and connectors should be utilized and may, in fact, be required by building codes.

  Most commonly available electroplated galvanized fasteners do not have a sufficient coating of zinc and are not recommended. Aluminum should not be used in direct contact with preservative treated wood. Never mix galvanized steel with stainless steel in the same connection.

2.0E GP Lam LVL Floor Beams



This table shows the size (e.g.: 2–11¼" = 2 plies of 1¾"x11¼") of beams needed to support loads of one floor only, i.e., a second story floor or one story floor over a basement. (See drawing at right.)

When floor joists span continuously from wall to wall (not cut at beam) this table requires that "B" be not less than 45%, or greater than 55% of "A".

Example: If "A" = 32', "B" must be between 14.4' (32 × .45) and 17.6' (32 × .55)

For non-conforming situations, use FASTBeam® analysis and selection software or contact BlueLinx.

NOTES:

1. Table is based on continuous floor joist span and simple or continuous beam span conditions. If floor joists are not continuous above the beam, take the sum of the joist spans then multiply by 0.8. This is the total floor joist span to consider.
2. Required end bearing length (based on 565 psi) is 3.8" unless the subscript + is shown. In that case, 4.5" is required.
3. At intermediate supports of continuous spans, use the following guidelines or refer to page 40.
   - 7¼" bearing length for beams requiring 3" bearing at the beam ends
   - 10½" bearing length for beams requiring 4½" bearing at the beam ends
4. All headers require full-width bearing support, e.g., 2x6 for 5½", 3-ply members. The adequacy of supporting columns to be verified by others.
5. Table is based on residential floor loading of 40 psf live load and 12 psf dead load and exterior wall weight of 100 plf.
6. Live load reductions have been applied per IBC section 1607.9.1.
7. Deflection is limited to L/360 at live load and L/240 at total load.
8. For other uniform load conditions refer to pages 42-43.
9. A single 3½" thick ply can be substituted for any two 1¾" thick plies.
10. For multiple ply fasteners, see pages 51-53.

NOTES:

1. Required end bearing length (based on 625 psi) is 3.3" unless the subscript + is shown. In that case, 4.5" is required.
2. All headers require full-width bearing support, e.g., 2x6 for 5½", 3-ply members. The adequacy of supporting columns to be verified by others.
3. Table is based on residential floor loading of 40 psf live load and 12 psf dead load and exterior wall weight of 100 plf.
4. A beam line supporting the center of the second floor is assumed.
5. Deflection is limited to L/360 and the lesser of L/240 or ¾" at total load.
6. Roof live and dead loads shown are applied vertically to the horizontal projection.
7. When using a single ply 1¾" consider the effect on hanger capacity, and the available bearing surface the LVL provides to other framing elements.
